

How Is **Bitcoin Private Key** Work 26-10-2025:

- Every blockchain address has both a public key and a private key.
- A public and private key will be generated every time you create a new blockchain address.
 - The public key allows other users to find and transact with you; the private key gives you access to the address and agency over its contents.
- You must safeguard your private key to truly own your cryptocurrency. Keeping your private keys safe is essential.

How Does a Private Key Work?

The tech behind private and public keys is quite complex, but it's part of a wider field of cryptography called Public Key Cryptography (PKC). To learn more about the details, check out the full article on Private vs. public Keys.

But essentially this technology uses a mathematical concept called a Trapdoor function. This means it's easy to compute in one direction but nearly impossible to reverse, and it provides the whole foundations upon which blockchains are built.

What Do Private Keys Look Like?

A blockchain private key is a randomly generated number with hundreds of digits. For simplicity, they are represented as a string of alphanumeric characters.

The private and public keys of Bitcoin wallets and Ethereum are generated using an algorithm called the Elliptic Curve Digital Signature Algorithm.

Let us look at how private keys look on different blockchains:

Ethereum: uses a private key made up of 64 hexadecimal characters.
`afdfd9c3d2095ef696594f6cedcae59e72dcd697e2a7521b1578140422a4f890.`

Bitcoin: uses a 256-bit number that can be represented in several ways.
`E9873D79C6D87DC0FB6A5778633389F4453213303DA61F20BD67FC233AA33262`

Either way, if you are looking at your private key, remember not to keep a record of it anywhere online. Your private key is the key to your assets, and no one should be looking at it.
