

## What Are **BRC-20 Tokens** 29-12-2025:

Bitcoin is the first and most popular Blockchain in existence. The primary purpose of the Bitcoin network has always been a decentralized, peer-to-peer money transfer system at its core, However, it's also often compared to digital gold, offering crypto users a secure store of value.

Well, the Taproot upgrade and the following innovation of the Bitcoin Ordinals protocol created a whole new world of opportunities on Bitcoin. Now, alternative assets have become a whole movement. New ideas attract further innovation and one such innovation is the BRC-20 protocol.

If that sounds confusing—fear not! Put simply, fungible tokens are digital assets that are identical and interchangeable. For example, let's imagine you have a physical coin. If you exchange this coin with another of the same kind, the value of your asset remains the same, even though it's not the same coin. This is the essence of fungibility; it means you can swap one with another identical version.

Commonly, you will encounter fungible tokens using decentralized applications. However, the Bitcoin network doesn't support complex smart contracts that enable this sort of application. As a result, Bitcoin was slower to evolve an ecosystem of alternative assets until the launch of the Ordinals protocol.

The ordinals protocol made it much easier to attach additional data (such as text, images, or audio) to a single Satoshi. This was possible since the Taproot upgrade, but cumbersome to those without development skills. Via Rodarmor's protocol, it's reasonably easy to inscribe sats with whatever information you need.

BRC-20 tokens are essentially ordinals inscribed with specific standardized information. To explain, BRC-20 tokens are always inscribed with JSON (JavaScript Object Notation) data. It's this code that gives the ordinal extra functionality. While the BRC-20 standard is still limited, this small amount of code allows you to deploy, mint, and transfer tokens on the Bitcoin network.
